Demonstration of Proposed Features

Date	21 October 2026
Team ID	TDS-AI-2026
Project Name	Personalized Travel Itinerary Planner
Maximum Marks	5 Marks

Project Title

Personalized Travel Itinerary Planner

Feature 1: AI-Powered Itinerary Generation

What it does: Generates a complete, personalized, day-by-day travel itinerary using Google Gemini LLM based on user inputs.

How to demonstrate:

1. Open the New Trip form
2. Enter: Destination = "Goa, India", Dates = 3 days, Budget = 20000 INR, Style = Balanced, Interests = "beaches, seafood, nightlife"
3. Click "Generate itinerary"
4. Show the loading spinner with the "AI is planning your trip" message
5. After 10-20 seconds, show the complete itinerary with Day 1, Day 2, Day 3 tabs

Expected Output: 3 days with 4-5 activities each including beach visits, restaurant recommendations, and transport, all with estimated costs that fit within the 20000 INR budget.

Feature 2: Multi-Day Navigation

What it does: Users can navigate between individual days of the itinerary using day selector buttons.

How to demonstrate:

1. On the Trip Detail page, show the row of "Day 1", "Day 2", "Day 3" buttons
2. Click each button to switch between days
3. Show that each day has its own activities, day summary, and cost
4. Show the trip header displaying total estimated cost vs. total budget

---

Feature 3: Activity Editing

What it does: Users can modify any detail of an individual activity including type, title, description, location name, start/end times, and estimated cost.

How to demonstrate:

1. Click the "Edit" button on any activity card
2. Show the Activity Edit Dialog with all fields pre-filled
3. Change the description and estimated cost
4. Click Save

5. Show the card updated in real-time without page refresh (React Query invalidation)

Feature 4: Activity Deletion

What it does: Users can delete individual activities from a day.

How to demonstrate:

1. Click the "Delete" button on an activity
2. Show the browser confirmation dialog
3. Confirm deletion
4. Show the activity removed from the list instantly

Feature 5: Drag-and-Drop Reordering

What it does: Users can reorder activities within a day by dragging them to new positions. Time slots are reassigned to maintain schedule logic.

How to demonstrate:

1. Find a day with 3+ activities
2. Click and hold the "Drag" handle button on an activity
3. Drag it above or below another activity
4. Release to drop in the new position
5. Show that the activity order is updated immediately (optimistic UI)
6. Explain that the backend reorder API is called to persist the new order

---

Feature 6: Day Regeneration

What it does: Replaces all activities on a selected day with a fresh AI-generated plan, while keeping all other days unchanged. Avoids repeating places from other days.

How to demonstrate:

1. Click "Regenerate day" button on Day 2
2. Show the confirmation dialog
3. Confirm and show the loading state "Regenerating... (10-20 sec)"
4. After completion, show that Day 2 has entirely new activities
5. Switch to Day 1 and Day 3 to confirm they are unchanged

Feature 7: Budget Tracking

What it does: Automatically computes per-activity, per-day, and total trip costs. Displays estimated cost vs. budget at all times.

How to demonstrate:

1. On the Dashboard, show each trip card displaying "Estimated: XXXX / Budget INR"
2. On the Trip Detail page, show "Estimated total: XXXX of YYYY INR" in the header
3. Show each day's "Day cost: XXXX INR"
4. Show each activity's cost in the top-right of each card

Feature 8: JWT Authentication & Security

What it does: All API requests require a valid JWT bearer token. Users can only access their own data through Row-Level Security policies.

How to demonstrate:

1. Open browser DevTools → Network tab
2. Make any API request (e.g., navigate to a trip)
3. Show the Authorization: Bearer <token> header in the request
4. Open Swagger UI at /docs, show the Authorize button
5. Explain that without a token, all endpoints return 401 Unauthorized
6. Explain RLS: even with a valid token, users only see their own trips

---

Feature 9: Responsive Design

What it does: The application is fully responsive and works on mobile, tablet, and desktop screens.

How to demonstrate:

1. Open Chrome DevTools → Device Toolbar
2. Switch to mobile view (375px width)
3. Show the Login page, Dashboard, and Trip Detail pages all adapting correctly
4. Show that activity cards stack vertically on mobile

Feature 10: Interactive API Documentation (Swagger UI)

What it does: The FastAPI backend automatically generates interactive API documentation with request/response schemas.

How to demonstrate:

1. Open https://personalized-travel-itenerary-planner.onrender.com/docs
2. Show all endpoints grouped by tags (health, me, trips, activities)
3. Expand POST /api/trips/generate and show the full request schema
4. Show the response schema (TripDetailOut with nested days and activities)
5. Click "Try it out" and authorize with a JWT token to test a live endpoint
